

1. Installing Viewing Software

If the viewing software (Imager and Indexr) are not installed on your PC, select the tools icon from the left side of your screen.

- a. Click on Imager for the correct version of the software (16 bit for Windows 3.X or 32 bit for Windows 95, 98, and NT). Imager must be loaded first.
- b. Click on "download" next to Imager software
- c. Make sure "Save this Program to Disk " is selected and click on OK. This will download a zipped file to the designated location on your PC. The file name is imagerXX.exe (as shown in the "save as" box). Please make note of the directory where the file is placed. If the directory is C:\windows\desktop, icons will be placed on your desktop. When download completed dialogue is displayed, click on OK.

Use the back button to return to the previous screen and repeat the steps above to load the Indexr and Adobe Acroread software.

Upon completion of downloading the last software package, minimize your internet browser.

Open up your Windows Explorer and go to directory where the executable files were downloaded. Starting with Imager, double click on imager.exe and follow the install instructions (unless you have a particular reason not to accept the defaults during installation, it is recommended that defaults be used). If you downloaded to your desktop, double click on each of the executables to start the install. Repeat these steps for the Indexr and Adobe Acroread software, if needed. A JEDMICS Toolset group will be created on your Start>Programs selection list. Imager and Indexr should be contained in the JEDMICS Toolset. If Adobe Acrobat is already installed on your PC, you probably have a directory C:\Acrobat3. If not, you probably need to also load the Adobe Acrobat Reader. Close your Windows Explorer (if you did not download to your desktop) and return to your internet browser. If you downloaded to your desktop, it is recommended that you delete the icons from your desk top prior to returning to your internet browser. Once your internet browser is open again, you will need to use your back button to return to the solicitation.

2. Viewing the solicitation

The TDP may be downloaded to your PC or you may choose to view the data directly from the web.

To view directly from the web, click on the filename (Example: 02.C4) you wish to view. The associated document numbers are shown on the same line. When you select the document you wish to view, the Imager software should launch and you can enlarge the drawing and view. If the Imager software does not launch, you need to make sure you have the latest version (5.1.0.4). To determine which version you have, launch the Imager software and select Help from the File Menu and then About Imager.

To download the TDP to your PC, click on the PRON#.zip (example: T19A1T54.zip). Make sure "Save this File to Disk" is selected, then click OK. Note the filename (T19A1T54.zip) and where the file is being saved to (example c:\). Once Download Complete dialogue is display, click on OK. This is a compressed (.zip) file that will need to be extracted.

If you do not have an unzip utility on your PC, you will also need to click on the "click here" to obtain the unzip software. Download the unzip.exe file to your PC. Once again make sure "Save This Program to Disk" is selected and that you make note of the directory where it is placed. When the download complete dialogue box is displayed, click OK. You may also download the unzip instructions, if you wish. Minimize your internet browser.

Open your Windows Explorer and go to the directory where you have downloaded the PRON.zip file (Example: T19A1T54.zip). Double click on the file name. Your unzip utility should open up and allow

you to extract the data to a directory named the same as the PRON. If you have to select a program to unzip the file (a window will coming up asking you which program the file should be opened with), use the scroll bar and go down and select zip.exe. If zip.exe is not there, click on OTHER at the bottom of the window, go to the directory where you downloaded the unzip.exe and double click on unzip.exe. Unzip.exe will then appear highlighted in the program window, then click on OK and this will extract the TDP.

Next you will want to start the Indexr program (Start>Programs>JEDMICS Toolset>Indexr) and select the file menu option and then open. You will be asked to select the type of file to open. Make sure index file is selected and click ok. The path for the file you want to open is c:\PRONNO\images\index.dlf (example: c:\T19A1T54\images\index.dlf). Once this is opened, a listing of the index data should be displayed on your screen. Double click any where on any line for the image you want to view. The Imager software will launch and you can enlarge the drawing and view as usual.
